

Ruby River: one visible accessibility blocker worth reviewing

A headless browser scan found a high-impact accessibility issue and highlighted the affected element below. This is a teaser snapshot, not a full WCAG audit, but it shows why remediation needs developer-ready evidence.

DETECTED ISSUE

button-name: Buttons must have discernible text

WCAG MAPPING

4.1.2 Name, Role, Value (Level A)

WHY IT MATTERS

If a button has no programmatic name, screen reader users may not know what action they are about to take. On revenue pages, that can block ordering, booking, checkout, or lead submission.

RISK FRAMING

Accessibility issues can increase exposure under WCAG-based procurement requirements, Section 508 expectations, state accessibility laws, and ADA-related demand letters. This teaser is not legal advice; it is a practical risk signal that should be validated through a full audit.

DEVELOPER-READY REMEDIATION

Buttons must have discernible text.

HTML PATTERN

```
<button aria-label="Close modal">
  <svg aria-hidden="true">...</svg>
</button>
```
